National Adult Maltreatment Reporting System

NAMRS Case Component

Data Specifications

June 23, 2016

THE PAPERWORK REDUCTION ACT OF 1995 (Pub. L. 104-13)
Public reporting burden for this collection of information is estimated to average 100 hours per response, including the time for reviewing instructions, gathering and maintaining the data needed, and reviewing the collection of information. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number.
I. Case Component Data Specifications

The Case Component includes information pertaining to each report that is screened in and investigated by the adult protective services (APS) agency. The Case Component data are extracted into the required Extensible Markup Language (XML) formatted file. The file is uploaded using the NAMRS website. The information is specific to the investigation, including the clients, maltreatments, and perpetrators associated with the specific investigation. A case is comprised of an investigation and any ancillary tasks that APS undertakes on behalf of the client. The Case Component collects data on APS cases that were closed during the reporting period. This component is designed to collect data on an annual basis. The reporting period is the Federal Fiscal Year (FFY), October 1st – September 30th.

The Case Component is comprised of six entities as shown in Fig 1. Case Component Entity Relationship Diagram and Fig 2. Example of Case Component Entities Relationships. Each entity is comprised of attributes. The six entities for the data submission are:

- Year/State—each FFY, reporting period, for which data are submitted by the APS agency
- Investigation—each investigation undertaken by APS with a case closure date during the reporting period
- Client—each person subject of an investigation and client may have multiple investigation in the reporting period
- Maltreatment Allegation—each maltreatment associated with each client, requires the attributes of maltreatment type and maltreatment disposition
- Perpetrator—each person determined to be responsible for one or more maltreatments with a disposition of substantiated
- Client-Perpetrator Relationship—the relationship between the client, who is the victim of a substantiated maltreatment, and the perpetrator, as explained by one or more of the eight possible attributes.
Fig 1. Case Component Entity Relationship Diagram

Fig 2. Example of Case Component Entities Relationships
On the following tables, the column “Cardinality” indicates if a data element can have multiple values. For example, a client may have received multiple types of benefits. An example of single cardinality is that there can be only one primary reason for case closure.

Some data elements have a tiered or nested structure of code values. For example, the data element race allows the client to be identified as Asian or as a specific Asian race. In such cases the specifications show the tiered structure by indenting the optional, more specific code values.

</table>

If the state collects specific Asian descent, then the code values of 21-27 can be submitted. If the client is Asian of Filipino and Japanese descent, submit codes 23 and 24. The code value 20=Asian (non-specific) should not be submitted since the specific Asian descent is known.

Some NAMRS Code Values include “none.” The “none” code value should be used to indicate that the information being asked for in the specific data element is known to be “none” vs. “unknown” or “not evaluated.” For example, the Behavioral Health Screenings or Diagnoses data element includes the code value 10=none. If the screening was conducted and the results indicated the client did not have any behavioral health issues, then submit 10=none. If, however, the screening was not conducted and it is not known if the client has any behavioral health issues, then the data element should be submitted as “unknown.” The code value of “none” cannot be used in conjunction with other codes values for the data element.

Definitions of specific data element values can be found in the NAMRS Definitions of Code Values.
### Table 1–Investigation Entity

Each reporting period submission may have multiple investigations.

<th>Cardinality</th>
<th>Type/Format</th>
<th>Code Values/Instructions</th>
</tr>
</thead>
</table>
| Clt5       | Age                        | The age of the client in years (at investigation start date).                        | No       | Single      | Enumeration (code)| 18,19…74 = actual age  
75 = 75 through 84  
85 = 85 and older  

The Client Age is computed by subtracting the client's Date of Birth from the Investigation Start Date. If the age ranges between 18 and 74, the actual age is used. Ages of 75 through 84 inclusive are grouped and coded as 75. Ages of 85 or older are grouped and coded as 85. The reason for the grouping of older ages is to further protect the possible identification of the older cohort population. |
| Clt6       | Gender identity            | The actual or perceived gender-related characteristics of the client.               | No       | Single      | Enumeration (code)| 1 = male

Table 3–Maltreatment Allegation Entity

Each client may have multiple maltreatment allegation entities within an investigation. Each maltreatment allegation entity must be composed of a maltreatment type and maltreatment disposition. NAMRS only allows each maltreatment type once per client per investigation and only one disposition per maltreatment type. For example, within an investigation, a client can have only one maltreatment allegation entity with neglect as the maltreatment type. A client can have multiple maltreatment allegation entities within the investigation, but the maltreatment type must be different for each one. A client can have more maltreatment allegation entities with the same maltreatment type in other investigations.

Some state systems allow multiple maltreatment types that are the same or similar for a client within an investigation. For example, a state may track more specific types of neglect such as, inadequate care and unsanitary conditions. Only one maltreatment allegation entity with neglect as the maltreatment type should be submitted for the client within the investigation. Follow the order of dispositions to decide which to submit if the dispositions are different: 1-Substaniatied, 2- Inconclusive, 3-Unsubmstantied, and 4=Other. For example, Substantiated would trump Inconclusive as the disposition.

Table 4–Perpetrator Entity

Each investigation may have zero, one, or more than one perpetrator. A perpetrator must be associated with at least one substantiated maltreatment investigation that is associated with a specific client within the investigation. A perpetrator may be associated with more than one investigation but a separate perpetrator entity is required for each of the associated investigations.

| Per7       | Behavioral health screenings or diagnoses | The results of assessments on the perpetrator, conducted by the APS agency. Multiple behavioral health code values can be submitted for the perpetrator. | No       | Multiple     | Enumeration (code) | 1 = alcohol use disorder  
2 = anxiety     
3 = bipolar disorder  
4 = dementia  
5 = depression  
6 = schizophrenia and other psychotic disorders  
7 = substance use disorder  
8 = traumatic brain injury  
9 = other  
10 = none                                      |

APS staff may perform assessments or screenings which indicate that a perpetrator may need referral to a health care professional. These assessments/screenings may be indicated by choosing the appropriate code values. In addition, APS staff may have access to medical records indicating a perpetrator’s diagnoses and if so choose appropriate code values.
### Table 5—Client Perpetrator Relationship Entity

Each client and perpetrator can have a designated relationship if data on one or more of the entity attributes is provided. A client and perpetrator have only one relationship entity within an investigation.

II. ID Hashing Guidelines

NAMRS requires states to de-identify all the state system IDs that will be reported in the case component (Investigation ID, Client ID, Perpetrator ID). Selecting the methodology for de-identifying the IDs is up to state discretion. However, the IDs reported to NAMRS should be alphanumeric.

One effective way to do this is by using a hashing methodology.

ID Hashing Guidelines:

- Each ID must be unique
- The method selected must give the same result every time the procedure is executed. In other words, a client ID must always yield the same hashed ID after processing.
- The hashed ID should only contain alphanumeric characters. No special characters are allowed.
- The state agency must maintain any algorithms, pass phrases, and keys used to hash the IDs.

A hashing algorithm is a one-way map function that maps any particular string to a fixed-length series of bytes. To do this, first decide on a password or passphrase. This is simply a string that will remain the same forever. The password can be the same for all the id fields, or they can be different. The password for a particular field should always remain the same forever. When using a password or passphrase as input to a hashing algorithm, it is commonly called a “salt”.

Then for each id field, do the following:
1. Prepend the salt to the id. (This is the “salted input”)
2. Hash the salted input using the MD5 hashing algorithm. Regardless of the length of the input, MD5 will always produce 32 bytes of output.
3. Finally, convert the 32-byte result to a 32 character (hexadecimal) string that can easily be inserted into the xml file.

Example:

For MS SQL Server, use the following SQL to obtain the hashed ID:

```sql
DECLARE @clearTextId VARCHAR(100) = '123-45-6789'
DECLARE @salt VARCHAR(100) = 'This is my complicated passphrase'

SELECT @clearTextId AS ClearText,
       @salt AS Salt,
       CONVERT(VARCHAR(32), HASHBYTES('MD5', @salt + @clearTextId), 2) AS HashedText
```
